Can Lipitor save Big Pharma?

MEGAN MCARDLE

B ig Pharma could look at offpatent drugs competing with generics for the overthe-counter space on the strength of brand name

It's long been in the works. Pfizer Inc. has begun testing an over-thecounter version of Lipitor, the blockbuster drug that has plumped up the pharmaceutical giant's coffers for more than a decade.

You may wonder: Why go OTC? Twenty years ago, that would have been a good question. Pharmaceutical companies tended to like prescription drugs; insurance companies paid for them, meaning that the patients tended to take them without worrying about price. Why go to the extra expense of testing your drug for the OTC market?

Insurance companies have becomealotmoreprice-sensitive over the years. Now they tend to pressfor generics to be prescribed unless there is some compelling reason to take the brand name. Which means that as drugs go off-patent—which Lipitor did at the end of 2011 there's quite a bit of wallet shock.

Lipitor is following a trail blazed by others such as Prilosec, which seems to have done very well as an OTC drug. At OTC prices, consumers may opt for a brand name just because ... well, it's a brand name, and what's a few extra dollars? You'll notice that there's still a lot of Advil on the shelves even though there are loads of generic equivalents available. This may be an increasingly common new life cycle for a drug: Patenta drug, let it runits course, maybe try some combo drugs to extend the patent's life, then let it go off-patent and compete as a premium brand on drugstore shelves. Can this save Big Pharma from the wave of blockbuster patent cliffs it has been experiencing? Not necessarily ... but it could extend the industry's shelf life.
